You have been given 1 year of data for water temperature along Piermont Pier (NOTE: 2013 data is from Norrie Point).

|  |  | Your Year |
| :---: | :---: | :---: |
| Dates with the <br> highest temp |  |  |
| Highest <br> temperature |  |  |
| Dates with the <br> lowest temp |  |  |
| Lowest <br> temperature |  |  |
| What is the <br> general trend <br> you notice <br> between the two <br> years? |  |  |
| Why do you <br> think this trend <br> exists? |  |  |

1. You will go up to a single piece of chart paper and graph certain data points for your specific year. Jot down the average temperature (marked Avg), the lowest temperature (marked L), and the highest temperature (marked H ).
2. You should have 3 points on the class graph: Avg, H, and L.
3. Discussion: What is happening to the average temperature in July? What is happening to the lowest temperature in July? What is happening to the highest temperature in July? What do you think we'd see in 10 years? In 20 years? What about 10 years in the past? 20 years in the past?
4. Evaluation: What are some sources of error in today's activity?
